L2 ANSWER 1 OF 19 USPATFULL on STN

TI Antifungal proteins

AB Antifungal proteins which are analogues of the **Rs-AFP2**  
protein and contain particular mutations in their amino acid sequence.  
The mutated proteins possess enhanced salt-tolerant antifungal activity.  
The proteins are useful for combating fungal diseases in agricultural,  
pharmaceutical or preservative applications.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

L2 ANSWER 3 OF 19 DGENE COPYRIGHT 2004 THOMSON DERWENT on STN  
 TI New active mutants of radish antifungal protein 2 - used to generate fungus-resistant plants or as therapeutic or preservative agents  
 AN AAW19616 Protein DGENE  
 AB This polypeptide comprises radish antifungal protein 2 (**Rs-AFP2**). Novel potent antifungal proteins (see AAW26371-90) based on **Rs-AFP2** contain at least 1 mutation selected from a basic residue at positions 9 or 39, and a **hydrophobic residue** at positions 5 or 16. Proteins containing Gln5Met (see AAW26379), Gly16Met (AAW26380), Gly9Arg (AAW26376), Val39Arg (AAW26377) or Gly9Arg plus Val39Arg (AAW26378) mutations are specifically claimed. A cDNA clone encoding **Rs-AFP2** preprotein can be modified by recombinant DNA methods to allow expression of mutant isoforms in yeast as mating factor alpha 1 fusion proteins. The **Rs-AFP2** mutants have enhanced salt tolerant antifungal activity, especially when expressed in plant tissue where that may have curative as well as protective effects. They are useful for combating fungal diseases in agricultural, pharmaceutical or preservative applications.

AN AAW26375 Protein DGENE  
AB This polypeptide comprises a Gln5Glu, Gly16Met, Arg27Asn mutant of radish antifungal protein 2 (**Rs-AFP2**) (see also AAW19616). Novel potent antifungal proteins (see AAW26371-90) are based on **Rs-AFP2** and contain at least 1 mutation selected from a basic residue at positions 9 or 39, and a **hydrophobic residue** at positions 5 or 16. Proteins containing Gln5Met (see AAW26379), Gly16Met (AAW26380), Gly9Arg (AAW26376), Val39Arg (AAW26377) or Gly9Arg plus Val39Arg (AAW26378) mutations are specifically claimed. A cDNA clone encoding **Rs-AFP2** preprotein can be modified by recombinant DNA methods to allow expression of mutant isoforms in yeast as mating factor alpha 1 fusion proteins. The **Rs-AFP2** mutants have enhanced salt tolerant antifungal activity, especially when expressed in plant tissue where that may have curative as well as protective effects. They are useful for combating fungal diseases in agricultural, pharmaceutical or preservative applications.

 DESCRIPTION: Radish antifungal protein 2 mutant (Q5E/G9R/R27N).

L2 ANSWER 19 OF 19 WPIDS COPYRIGHT 2004 THOMSON DERWENT on STN

TI New active mutants of radish antifungal protein 2 - used to generate fungus-resistant plants or as therapeutic or preservative agents.

AN 1997-332785 [30] WPIDS

AB WO 9721814 A UPAB: 19970723

New antifungal protein (A) is substantially homologous to the radish antifungal protein 2 sequence (**Rs-AFP2**), but contains at least one of the mutations: basic residue at positions 9 or 39, and **hydrophobic residue** at positions 5 or 16: QKLCQRPSGT WSGVCGNNNA CKNQCIRLEK ARHGSCNYVF PAHKCICYFPC (**Rs-AFP2**)

). Also new are: (1) antifungal peptides (B) comprising a sequence of at least 6 amino acids from (A), provided they include at least one of the mutations; (2) DNA (I) encoding (A) or (B); (3) a vector containing (I); and (4) a biological system, preferably a plant, containing (I) and expressing (A) or (B).

USE - Plants containing (I) have improved resistance to fungi (claimed). Compositions containing (A) or (B) can be used to control fungi or bacteria for agricultural, pharmaceutical or preservative purposes, e.g. treatment of Candida infections or as food additives, and for protection of crops or harvested produce. When applied to plants they may have curative as well as protective actions. Also contemplated is protection of plants by introducing into the soil or plant itself a microorganism able to express (A) or (B).

ADVANTAGE - Compared with **Rs-AFP2** itself, (A) and (B) have better activity in presence of high salt concentration (especially in plant tissue).

L5 ANSWER 1 OF 1 BIOSIS COPYRIGHT 2004 BIOLOGICAL ABSTRACTS INC. on STN  
 TI Antimicrobial peptides from *Mirabilis jalapa* and *Amaranthus caudatus*: Expression, processing, localization and biological activity in transgenic tobacco.  
 AB The cDNAs encoding the seed antimicrobial peptides (AMPs) from *Mirabilis jalapa* (Mj-AMP2) and *Amaranthus caudatus* (Ac-AMP2) have previously been characterized and it was found that Mj-AMP2 and Ac-AMP2 are processed from a precursor preprotein and preproprotein, respectively (De Bolle et al., Plant Mol Biol 28:713-721 (1995) and 22:1187-1190 (1993), respectively). In order to study the processing, sorting and biological activity of these antimicrobial peptides in transgenic tobacco, four different gene constructs were made: a Mj-AMP2 wild-type gene construct, a Mj-AMP2 mutant gene construct which was extended by a sequence encoding the barley lectin carboxyl-terminal propeptide, a known vacuolar targeting signal (Bednarek and Raikhel, Plant Cell 3: 1195 - 1206 (1991)); an Ac-AMP2 wild-type gene construct; and finally, an Ac-AMP2 mutant gene construct which was truncated in order to delete the sequence encoding the genuine carboxyl-terminal propeptide. Processing and localization analysis indicated that an isoform of Ac-AMP2 with a cleaved-off carboxyl-terminal arginine was localized in the intercellular fluid fraction of plants expressing either wild-type or mutant gene constructs. M-jAMP2 was recovered extracellularly in plants transformed with Mj-AMP2 wild-type gene construct, whereas an Mj-AMP2 isoform with a cleaved-off carboxyl-terminal arginine accumulated intracellularly in plants expressing the mutant precursor protein with the barley lectin propeptide. The in vitro antifungal activity of the AMPs purified from transgenic tobacco expressing any of the four different precursor proteins was similar to that of the authentic proteins. However, none of the transgenic plants showed enhanced resistance against infection with either *Botrytis cinerea* or *Alternaria longipes*.

L7 ANSWER 1 OF 113 MEDLINE on STN  
TI The three-dimensional solution structure of NaD1, a new floral defensin from *Nicotiana alata* and its application to a homology model of the crop defense protein alfAFP.  
AB NMR spectroscopy and simulated annealing calculations have been used to determine the three-dimensional structure of NaD1, a novel antifungal and insecticidal protein isolated from the flowers of *Nicotiana alata*. NaD1 is a basic, cysteine-rich protein of 47 residues and is the first example of a plant defensin from flowers to be characterized structurally. Its three-dimensional structure consists of an alpha-helix and a triple-stranded antiparallel beta-sheet that are stabilized by four intramolecular disulfide bonds. NaD1 features all the characteristics of the cysteine-stabilized alphabeta motif that has been described for a variety of proteins of differing functions ranging from antibacterial insect defensins and ion channel-perturbing scorpion toxins to an elicitor of the sweet taste response. The protein is biologically active against insect pests, which makes it a potential candidate for use in crop protection. NaD1 shares 31% sequence identity with alfAFP, an **antifungal protein** from alfalfa that confers resistance to a fungal pathogen in transgenic potatoes. The structure of NaD1 was used to obtain a homology model of alfAFP, since NaD1 has the highest level of sequence identity with alfAFP of any structurally characterized antifungal defensin. The structures of NaD1 and alfAFP were used in conjunction with structure-activity data for the radish defensin **Rs-AFP2** to provide an insight into structure-function relationships. In particular, a putative effector site was identified in the structure of NaD1 and in the corresponding homology model of alfAFP.

L7 ANSWER 2 OF 113 MEDLINE on STN

TI Synthetic peptides derived from the beta2-beta3 loop of *Raphanus sativus*  
**antifungal protein 2** that mimic the active site.

AB Rs-AFPs are antifungal proteins, isolated from radish (*Raphanus sativus*)  
seed or leaves, which consist of 50 or 51 amino acids and belong to the  
plant defensin family of proteins. Four highly homologous Rs-AFPs have  
been isolated (Rs-AFP1-4). The structure of Rs-AFP1 consists of three  
beta-strands and an alpha-helix, and is stabilized by four cystine  
bridges. Small peptides deduced from the native sequence, still having  
biological activity, are not only important tools to study  
structure-function relationships, but may also constitute a commercially  
interesting target. In an earlier study, we showed that the antifungal  
activity of **Rs-AFP2** is concentrated mainly in the  
beta2-beta3 loop. In this study, we synthesized linear 19-mer peptides,  
spanning the entire beta2-beta3 loop, that were found to be almost as  
potent as **Rs-AFP2**. Cysteines, highly conserved in the  
native protein, are essential for maintaining the secondary structure of  
the protein. Surprisingly, in the 19-mer loop peptides, cysteines can be  
replaced by alpha-aminobutyric acid, which even improves the antifungal  
potency of the peptides. Analogous cyclic 19-mer peptides, forced to  
adopt a hairpin structure by the introduction of one or two non-native  
disulfide bridges, were also found to possess high antifungal activity.  
The synthetic 19-mer peptides, like **Rs-AFP2** itself,  
cause increased Ca<sup>2+</sup> influx in pregerminated fungal hyphae.

L7 ANSWER 3 OF 113 MEDLINE on STN

TI The active site of drosomycin, a small insect **antifungal**

protein, delineated by comparison with the modeled structure of **Rs-AFP2**, a plant **antifungal protein**.

AB Drosomycin is the first strictly **antifungal protein** isolated from an insect (*Drosophila melanogaster*). The solution structure of this 44-residue protein has been reported previously. It involves a three-stranded beta-sheet and an alpha-helix, the protein global fold being maintained by four disulfide bridges. **Rs-AFP2** is a plant **antifungal protein** exhibiting 41% sequence similarity with drosomycin. Mutational analysis of **Rs-AFP2** showed the importance of some residues in the antifungal activity of the protein against the fungus target. In order to determine the structural features responsible for antifungal activity in both drosomycin and **Rs-AFP2**, we modeled the three-dimensional structure of **Rs-AFP2**, and of other antifungal proteins, using the solution structure of drosomycin as a template. Structure analysis of drosomycin and **Rs-AFP2**, and comparisons with the other modeled antifungal structures, revealed that the two proteins shared a hydrophobic cluster located at the protein surface in which a lysine residue is embedded. Based on these close structural similarities and the experimental data available for **Rs-AFP2** mutants, an antifungal active site of the insect protein is proposed.

TI Antifungal activity of synthetic 15-mer peptides based on the **Rs-AFP2** (*Raphanus sativus* **antifungal protein** 2) sequence.

AB Plant defensins are a class of cysteine-rich peptides of which several members have been shown to be potent inhibitors of fungal growth. A series of overlapping 15-mer peptides based on the amino acid sequence of the radish **antifungal protein Rs-AFP2** have been synthesized. Peptides 6, 7, 8 and 9, comprising the region from cysteine 27 to cysteine 47 of **Rs-AFP2** showed substantial antifungal activity against several fungal species (minimal inhibitory concentrations of 30-60 micrograms/mL), but no activity towards bacteria (except peptide 6 at 100 micrograms/mL). The active peptides were shown to be sensitive to the presence of cations in the medium and to the composition and pH of the medium. When present at a subinhibitory concentration (20 micrograms/mL), peptides 1, 7, 8 and 10 potentiated the activity of **Rs-AFP2** from 2.3-fold to 2.8-fold. By mapping the characteristics of the active peptide on the structure of **Rs-AFP2** as determined by nuclear magnetic resonance, the active region of the **antifungal protein**

appears to involve beta-strands 2 and 3 in combination with the loop connecting those strands. A cyclized synthetic mimic of the loop, cysteine 36 to cysteine 45, was shown to have antifungal activity. Substitution of tyrosine 38 by alanine in the cyclic peptide substantially reduced the antifungal activity, indicating the importance of this residue for the activity of **Rs-AFP2** as demonstrated carrier by mutational analysis.

TI Small cysteine-rich antifungal proteins from radish: their role in host defense.

AB Radish seeds have previously been shown to contain two homologous, 5-kD cysteine-rich proteins designated *Raphanus sativus*-antifungal protein 1 (**Rs-AFP1**) and **Rs-AFP2**, both of which exhibit potent antifungal activity in vitro. We now demonstrate that these proteins are located in the cell wall and occur predominantly in the outer cell layers lining different seed organs. Moreover, **Rs-AFPs** are preferentially released during seed germination after disruption of the seed coat. The amount of released proteins is sufficient to create a microenvironment around the seed in which fungal growth is suppressed. Both the cDNAs and the intron-containing genomic regions encoding the **Rs-AFP** preproteins were cloned. Transcripts (0.55 kb) hybridizing with an **Rs-AFP1** cDNA-derived probe were present in near-mature and mature seeds. Such transcripts as well as the corresponding proteins were barely detectable in healthy uninfected leaves but accumulated systemically at high levels after localized fungal infection. The induced leaf proteins (designated **Rs-AFP3** and **Rs-AFP4**) were purified and shown to be homologous to seed **Rs-AFPs** and to exert similar antifungal activity in vitro. A chimeric **Rs-AFP2** gene under the control of the constitutive cauliflower mosaic virus 35S promoter conferred enhanced resistance to the foliar pathogen *Alternaria longipes* in transgenic tobacco. The term "plant defensins" is proposed to denote these defense-related proteins.

TI Expression of functional *Raphanus sativus* **antifungal protein** in yeast.  
AB **Rs-AFP2** is a 51 amino acid cysteine-rich peptide isolated from radish (*Raphanus sativus*) seeds that exhibits potent inhibitory activity against filamentous fungi. A cDNA clone encoding the **Rs-AFP2** preprotein was modified by recombinant DNA methods to allow expression in the yeast *Saccharomyces cerevisiae*. This peptide was expressed in yeast as a fusion protein carrying at its N-terminus the prepro-sequences derived from the precursor of the yeast pheromone mating factor alpha 1. These sequences allow secretion of the biologically active peptide in a correctly processed form. Deletion of the mating factor alpha 1 pro-peptide drastically reduced the expression level of the peptide.

TI Antifungal polypeptide and methods for controlling plant pathogenic fungi  
AB An antifungal polypeptide, AlyAFP, that controls fungal damage to plants is provided. DNA encoding this polypeptide can be cloned into vectors for transformation of plant-colonizing microorganisms or plants, thereby providing a method of inhibiting fungal growth on plants. The polypeptide can be formulated into compositions that can be used to control undesired fungi on plants and elsewhere.

 TI DNA sequences encoding antifungal proteins  
 AB The present invention provides DNA sequences encoding antifungal peptides which comprise at least six amino acid residues identical to a run of amino acid residues found between position 21 and position 51 of the **Rs-AFP2 antifungal protein** sequence (SEQ ID NO: 35) or a substantially homologous protein. The peptides are useful for combating fungal diseases in agricultural, pharmaceutical or preservative applications

TI Plant-derived molecules and genetic sequences encoding same and uses therefor

AB The present invention provides genetic molecules encoding plant floral defensin-like molecules and their use in generating transgenic plants having resistance or at least reduced sensitivity to plant pests including insects, microorganisms, fungi and/or viruses. The present invention further provides for the use of floral- and seed-derived defensins in the generation of insect resistance in plants. The plants may be monocotyledonous or dicotyledonous plants and are in particular, crop plants and ornamental flowering plants. The genetic molecules are also useful in generating recombinant defensin-like molecules for use in the topical application of compositions to prevent or otherwise retard pest-infestation of plants. The floral defensin-like molecules or genetic molecules encoding same of the present invention may be used alone or in combination with other agents such as a proteinase inhibitor precursor or a nucleic acid molecule encoding same or other molecules or their encoding nucleotide sequences.
